

Harmonizing Global Business – in any language.

An end-to-end translation management system that streamlines localization projects through its use of integrated technology and client customization

Managing translation and localization projects can be a major undertaking consisting of multiple challenging steps. Octave TMS from ULG integrates processes and workflows that meet the regulatory and language quality needs of our clients in one powerful, scalable, and easy-to-use tool.

AN ALL-IN-ONE SOLUTION

Octave is a secure, web-based Translation Management System (TMS) that allows clients to submit projects, approve estimates, initiate project change orders and view real-time project status. In this password-protected environment, clients are able to communicate directly with linguists and project managers from anywhere, at any time. Octave's machine translation, terminology management and API features provide automated solutions to combat the bottlenecks often encountered in the localization process.

Octave is an end-to-end translation management solution for projects of any size, integrating clients, vendors and projects managers in order to centrally manage workflows and allow for complete transparency throughout the project lifecycle.

CUSTOMIZABLE, SCALABLE, AND POWERFUL

All of the reporting and project submission tools within Octave are customizable to meet the specific needs of our clients and end-users. Octave's reporting features allow clients to review and track spending, wordcounts, and on-time deliveries at any time. Clients can also contact a project manager via Octave should questions or concerns about a project arise. Access to ULG's technology support team is available 24/7 in all global timezones to ensure every project submitter has the support necessary for a successful localization project.

CENTRALIZED PROCESSES AND SERVICES

Octave's proprietary translation technologies enable clients to speed up the localization process and cut costs. Octave comes equipped with its own machine translation, terminology management, API and data security applications to improve productivity and eliminate redundant processes.

ULG's full suite of translation applications and products are incorporated into Octave TMS, which provides added scalability and power to clients with evolving needs for language services. These include:

- OctaveMT, 'gisting' machine translation and language identification
- OctaveMT+, machine translation with language identification, optical character recognition and quality improvement plans to increase efficiency and cost savings
- OctaveX, ULG's translation memory and glossary exchange application
- OctaveAPI, a CMS connector tool to improve the efficiency of project submission and final file delivery
- OctaveKey, ULG's secure translation portal for clients who must adhere to the most strict security standards
- ULG Intelligence, an interactive how-to guide that provides tutorials on ULG technologies
